A. Introduction

Datetime booking requirement:

- Start time, end time match with each employee **(1)**
 - Monday - Tuesday: 10:00 - 19:00
 - Tuesday - Friday: 9:00 - 18:00
 - Saturday: 9:00 - 15:00
 - Sunday: 9:00 - 20:00
- Start time on current day should in the next 30-min of current time **(2)**
 - Current time is 10:20 => the earliest booking should be at 10:50
- Start time booking + Time of services should not later than End Time **(3)**
 - Booking at 15:00 with 2-hour services will not be available if the end time is 16:00
- **New booking will not intersect the other booking (the most important) (4)**
 - The ongoing booking at 14:00 with 2-hour services. Then the earliest available time should be from 16:00 to the end of time.

B. Source code for concept

Solve the (1) problem

```
SELECT
    employees.employee_id id,
    employees.first_name firstname,
    employees.last_name lastname
FROM employees, employees_schedule
where employees.employee_id = employees_schedule.employee_id
and employees_schedule.day_id = weekday(date(?))+1 and
employees_schedule.from_hour <= time(?) and time(?) <= employees_schedule.to_hour
```

The (2) problem is solved with some basic formula

```
26     if ($isstartdate)
27         // $start = date("H:00"); //get time now by time zone
28         if (isset($_GET['admin'])){
29             $start = $open_time;
30         }else{
31             $step = date("i") + constant("nexttimestep") + (constant("nexttimestep") - (int)date("i")%constant("nexttimestep")); //
32             next earliest time slot
33             $start = date("H:i", strtotime(date("H:i")) + $step*60);
34         }
35     else
36         $start = $open_time;
```

The (3) and (4) problems are solved by multiple queries to check the empty of the time slot, then add it to the array

- We need to negate the statement of available appointments using Discrete mathematics
=> Busy appointments with stylists
- Then we just except it with available stylists

```
except
SELECT
    employees.employee_id id,
    employees.first_name firstname,
    employees.last_name lastname
from employees, appointments
where
    employees.employee_id = appointments.employee_id
    and appointments.canceled = 0
    and date(appointments.start_time) = date(?)
    and ( (
        ? >= appointments.start_time
        or ? > appointments.start_time
    )
        and (
            appointments.end_time_expected > ?
            or appointments.end_time_expected >= ?
        )
    )
);
```

C. Proof of concept

We use Postman to test this function

There are time slots on a new day 24-06-2022 (the current is 21-06-2022). All time slot is empty from open time to end time, with these stylists available at that time.

```
[{"09:30": [{"id": 4, "firstname": "Paul", "lastname": "Pogba"}, {"id": 5, "firstname": "David", "lastname": "Luis"}, {"id": 6, "firstname": "Erling", "lastname": "Haaland"}]}
```

There are time slots on the current day (30-07-2022 16:02). The earliest time slot will be 16:30, later than at least 30mins from now. (2)

```

1  {}
2  "16:30": [
3      {
4          "id": 4,
5          "firstname": "Paul",
6          "lastname": "Pogba"
7      },
8      {
9          "id": 5,
10         "firstname": "David",
11         "lastname": "Luis"
12     },
13     {
14         "id": 6,
15         "firstname": "Erling",
16         "lastname": "Haaland"
17     }
18 ]

```

After the customer books a 1-hour service from 11:00, the time slot from 11:00 to 12:00 will disappear the busy stylists, avoid intersecting appointments

```

104     "11:00": [
105         {
106             "id": 5,
107             "firstname": "David",
108             "lastname": "Luis"
109         },
110         {
111             "id": 6,
112             "firstname": "Erling",
113             "lastname": "Haaland"
114         }
115     ],
116     "11:15": [
117         {
118             "id": 5,
119             "firstname": "David",
120             "lastname": "Luis"
121         },
122         {
123             "id": 6,
124             "firstname": "Erling",
125             "lastname": "Haaland"
126         }
127     ],
128     "11:30": [

```
